

EPLC (Enterprise Performance Life Cycle)

→ Structured process used in govt or large organizations to manage IT projects

10 phases of EPLC

6 Test phase

→ make sure the system works properly and there are no bugs
eg. Testers try to book appointments through the app and see if app responds correctly

7 Implementation phase

→ System is launched for real users to use it
eg. app goes live and patients start booking appointments

Operation & Monitoring phase

→ System is monitored and any issues coming up are fixed
eg. if user reports an error or requests new features

Disposition phase

→ system is shut down or replaced when no longer needed
eg. After 15 years, hospital replaces this app

Governance phase

→ A team checks if the project follows rules, stays on budget and meets goals
eg. A review board regularly keeps track of the project

EPLC (Enterprise Performance Life Cycle)

→ Structured process used in govt or large organizations to manage IT projects

10 phases of EPLC

1. Concept phase
- idea for the project
 why is it needed
eg. hospital wants to
create an app for patients
to book appointments online

2. Planning phase
- setting goals, budget
 and team roles
eg. hospital decides on
the cost, timeline and
who will develop the app

Requirement phase
- what the system
 should do
eg. app lets users
create accounts,
book appointments,
set reminders

Design phase
- how the system
 will look
eg. Developers will
design layout of app
and how users
move from screen to
screen

Development phase
- actual system is
 built/developed (coded)
eg. app is programmed
using coding in
Java or Python

History of BI

1960

Simple DSS

- manual methods to help managers make decisions
- collected data in the form of reports
- eg from the report, manager gets idea on how many items are sold and not

1970 - 1980

Databases and OLAP

Databases - store large amt of data efficiently

OLAP - to explore data from diff regions, and of diff products

eg. Manager/Sales Analyst can know the sales of a region for a product A, and compare with B

1990

Data Warehouses

(Centralized approach)

- all business data stored in one system
- easy to combine and analyze data of (IT, finance, HR)

2000

Dashboard & Self Service BI

- more usefulness
- Visual presentation
- real time charts and graphs
- even non-technical people can understand

2010 - now

cloud BI, AI, ML

→ accessible via internet from anywhere

→ predicts future trends

eg. A retail company uses AI to predict sales in next month for a product
